Business Insights Report

Global Engineering and ESG Performance

Turning Operational Data into Commercial Intelligence

ESG | Financial Performance | Supply Chain | Macro Economic Context

Prepared by John Salter Oseyi, Data Analyst

October 2026 | Confidential: For Board Use Only

180,519	11,000	261	2015-2025
Orders Analysed	Company-Year ESG Records	Countries in Macro Dataset	Analysis Period

Executive Summary

What this data tells us and what the board should do about it

This report translates findings from a multi-source analytical dashboard covering 1,000 global engineering and industrial companies across 2015 to 2025 into actionable commercial intelligence. Three datasets have been integrated, modelled, and analysed to surface the insights below. The findings are presented in order of commercial urgency.

54.8%	+76%	£51.4M	95.3%
of orders carry late delivery risk	rise in carbon emissions 2015 to 2025	total portfolio revenue at 10.9% avg margin	First Class shipping late delivery rate

The Central Commercial Finding

Revenue is growing (+99% over 10 years) but carbon emissions are growing almost as fast (+76%). ESG scores are improving slowly (+12.4% over 10 years) but the pace of improvement is not keeping up with emissions growth. Simultaneously, more than half of all supply chain orders carry late delivery risk, a structural operational problem suppressing profitability. The board faces two parallel priorities: accelerating ESG decarbonisation and fixing supply chain reliability before both become regulatory and reputational liabilities.

SECTION 1

ESG and Environmental Performance

Global average: 54.62 / 100 | 2015 to 2025 | 1,000 companies across 9 industries

F1 Europe Leads ESG: Middle East and Africa Are Critically Behind

Europe achieves an average ESG score of 67.87, the only region above 65 and 24 points ahead of the Middle East (43.44) and 23 points ahead of Africa (44.51). This gap is not merely a performance difference; it is a regulatory and investment risk signal. European companies are closest to meeting emerging mandatory ESG disclosure requirements (CSRD and TCFD), while Middle Eastern and African operations face the greatest exposure to incoming cross-border carbon adjustment mechanisms. Oceania (62.44) and North America (61.22) perform moderately well while Asia (51.90) and Latin America (50.52) sit just below the global average of 54.62.

Region	Avg ESG Score	Avg Revenue (£)	Total Carbon Emissions	Risk Level
Europe	67.87	£5,595	2.39 Billion	Low
Oceania	62.44	£4,399	2.55 Billion	Low-Medium
North America	61.22	£4,694	2.37 Billion	Low-Medium
Asia	51.90	£4,183	1.87 Billion	Medium
Latin America	50.52	£5,667	1.71 Billion	Medium
Africa	44.51	£4,061	1.66 Billion	High
Middle East	43.44	£4,177	1.44 Billion	High

F2 Finance and Technology Lead ESG: Energy and Transportation Must Improve

Finance (64.62) and Technology (63.35) are the ESG leaders by industry. Critically, Technology also generates the highest revenue (£16.5M) and the highest profit margin (18.80%), directly demonstrating that strong ESG performance and strong financial performance are not in conflict. Energy (49.01) and Transportation (46.03) are the worst ESG performers. Energy is particularly concerning: it generates £10.5M in revenue (second highest) but produces 9.73 billion units of carbon emissions, more than all other industries combined. This represents the single largest carbon reduction opportunity in the portfolio.

Industry	Avg ESG	Avg Revenue	Profit Margin	Total Carbon	Priority
Finance	64.62	£6,274	14.29%	89.6M	Maintain
Technology	63.35	£15,773	18.80%	470.7M	Maintain
Healthcare	57.25	£4,654	15.45%	446.3M	Improve
Retail	55.68	£1,613	5.49%	151.2M	Improve
Consumer Goods	54.83	£2,099	10.81%	434.3M	Improve
Utilities	51.60	£1,244	9.68%	1.02B	High Priority
Manufacturing	50.46	£2,314	8.49%	802.6M	High Priority
Energy	49.01	£8,799	10.55%	9.73B	Critical
Transportation	46.03	£1,126	5.37%	836.9M	Critical

F3 Revenue Growing +99% But Carbon Emissions Up +76%: Decoupling Required

Portfolio revenue grew from £3.31M in 2015 to £6.58M in 2025, a 99% increase over 10 years. However, carbon emissions grew from 992 million units in 2015 to 1.75 billion units in 2025, a 76% increase over the same period. ESG scores improved from 51.44 to 57.83, only a 12.4% improvement. The data reveals a critical structural problem: the portfolio is growing revenues efficiently but has not decoupled that growth from carbon output. Without deliberate intervention, the carbon trajectory will increasingly conflict with incoming regulatory requirements and investor ESG mandates, creating material financial exposure.

F4 Higher ESG Score Correlates Positively With Higher Revenue

Statistical analysis reveals a positive correlation of 0.149 between ESG Overall score and Revenue across all 11,000 company-year records. Companies with higher ESG scores also tend to achieve higher profit margins (correlation 0.088). This data supports the business case that ESG investment is not a cost centre; it is a commercial lever. The Technology sector demonstrates this most clearly, combining the second-highest ESG score with the highest revenue and highest profit margin in the portfolio.

SECTION 2

Supply Chain Operational Performance

180,519 orders | 2015 to 2018 | 5 global markets | Total sales: £36.8M

F5 54.8% Late Delivery Risk: A Structural Crisis Not an Outlier

Of 180,519 supply chain orders analysed, 98,977 carry a late delivery risk, representing 54.8% of the total order book. A further 57.3% of orders were actually delivered late when measured against scheduled shipping dates, with an average delay of 0.57 days per order. This is not a temporary performance issue; it is a structural operational problem consistently present across all five markets. Europe has the highest total sales (£10.9M) but still carries a 55% late delivery risk rate, demonstrating the problem is not market-specific.

Market	Total Sales	Total Orders	Avg Profit / Order	Late Delivery Risk
Europe	£10,872,397	50,252	£23.27	55%
LATAM	£10,277,613	51,594	£21.77	54%
Pacific Asia	£8,273,744	41,260	£20.79	55%
USCA	£5,066,529	25,799	£21.87	55%
Africa	£2,294,453	11,614	£21.70	55%

F6 First Class Shipping Has 95.3% Late Delivery Rate: Premium Mode Is Worst Performer

The most significant operational anomaly in the supply chain data is the performance of First Class shipping. Despite being the premium shipping option, First Class has a late delivery risk rate of 95.3%, the highest of all shipping modes. Standard Class, the lowest cost option, has only a 38.1% late delivery rate, the best performing mode in the network. Customers paying a premium for First Class are experiencing the worst delivery performance. This is both a customer satisfaction problem and a brand reputation risk requiring immediate operational investigation.

Shipping Mode	Total Orders	Total Sales	Late Delivery Risk	Performance
Standard Class	107,752	£22,022,392	38.1%	Best
Same Day	9,737	£1,942,529	45.7%	Good
Second Class	35,216	£7,145,445	76.6%	Poor
First Class	27,814	£5,674,370	95.3%	Critical

F7 4.3% Cancellation Rate: Approximately £1.58M in Direct Revenue Leakage

7,754 orders were cancelled during the analysis period, representing 4.3% of the total order book. At an average sales value of £203.80 per order, this represents approximately £1.58 million in lost revenue. The delivery status breakdown shows only 17.8% of orders fulfilling on schedule: 54.8% Late, 23.0% Advance shipping, 17.8% On time, 4.3% Cancelled. Western Europe (£5.9M) and Central America (£5.7M) are the two highest-value regions; protecting delivery performance in these markets will have the greatest revenue impact.

SECTION 3

Macro Economic Context

261 countries | World Bank Development Indicators | 2015 to 2024

F8 COVID-19 Created a Structural Break: Recovery Is Uneven Across Markets

Global average GDP per capita fell from £17,537 in 2019 to £16,283 in 2020, a 7.1% decline representing the sharpest single-year contraction in the analysis period. Recovery was strong in 2021 (£18,803, a 15.5% rebound) but has since moderated. Average global unemployment sits at 7.3% with extreme variation from 0.1% in the most developed economies to 36.5% in the most constrained markets. Markets with high unemployment and low GDP per capita present cost efficiency opportunities in logistics and labour while carrying higher risk for premium product positioning.

Year	Avg Global GDP Per Capita	Key Event	Commercial Implication
2015	£15,661	Baseline year	Reference point for all growth metrics
2019	£17,537	Pre-COVID peak	Strongest pre-disruption position
2020	£16,283	COVID-19 impact	7.1% contraction: supply chain stress peak
2021	£18,803	Rapid recovery	15.5% rebound: demand surge risk
2022	£19,477	Continued growth	Supply chain normalisation period
2023	£20,172	Sustained recovery	New baseline establishing
2024	£19,725	Slight moderation	Monitor for slowdown signals

F9 Digital Connectivity Correlates With Economic Development and ESG Capability

Analysis of GDP per capita against internet user penetration across 261 countries reveals a clear positive relationship: wealthier countries have significantly higher digital connectivity. High-connectivity markets are better positioned for digital supply chain integration, real-time ESG reporting, and data-driven operational management. Markets with low internet penetration face structural barriers to adopting the digital tools that improve ESG performance and supply chain reliability. This explains in part why Africa and the Middle East lag on ESG scores: the infrastructure for data-driven governance is less developed in those regions.

SECTION 4

Commercial Recommendations

Five board-level actions ranked by commercial urgency

R1 Immediate Investigation into First Class Shipping Failure

Action Required

Commission an urgent operational review of First Class shipping logistics across all five markets. Map the end-to-end fulfilment process for First Class orders, identify where delays are introduced, and benchmark against Standard Class processes. Suspend marketing of First Class as a premium option until performance is brought below 50% late delivery risk.

Expected Commercial Impact

Reducing First Class late delivery risk from 95.3% to below 50% protects an estimated £2.8M in annual premium shipping revenue and significantly reduces customer churn. Every percentage point reduction in total late delivery risk reduces reputational exposure and refund costs.

R2 Decarbonisation Investment Programme: Energy Sector First

Action Required

Develop a structured decarbonisation roadmap for Energy sector holdings as phase one, with Manufacturing and Transportation as phase two. Set sector-specific carbon reduction targets aligned with Science Based Targets initiative (SBTi) methodology with quarterly board reporting. Introduce carbon intensity as a mandatory KPI alongside revenue in all reporting.

Expected Commercial Impact

Energy produces 9.73 billion carbon units, more than all other sectors combined, on £10.5M revenue. A 20% Energy sector carbon reduction would reduce total portfolio carbon intensity by more than 10%. Without action, incoming carbon border adjustment mechanisms represent a direct financial liability to Energy revenues from European and North American markets.

R3 Regional ESG Investment: Africa and Middle East Targeted Programme

Action Required

Allocate dedicated ESG improvement investment to Africa and Middle East operations focused on governance infrastructure, environmental monitoring capability, and social programme development. Establish region-specific ESG targets with a minimum improvement of 10 points over 3 years, moving both regions above the global average of 54.62.

Expected Commercial Impact

Closing the ESG gap between the Middle East (43.44) and the global average (54.62) improves investment attractiveness and reduces exposure to ESG-linked financing restrictions. Given the positive correlation between ESG score and revenue (0.149), a 10-point ESG improvement is associated with measurable revenue growth at the company level.

R4 Redirect Premium Shipping Investment to Standard and Same Day

Action Required

Reallocate marketing and capacity investment from First Class to Standard Class and Same Day shipping modes. Standard Class serves 107,752 orders with only 38.1% late delivery risk and generates £22M in sales. Same Day performs at 45.7% late delivery risk and commands premium pricing. Both significantly outperform First Class. Consider retiring First Class branding until performance is corrected.

Expected Commercial Impact

Shifting 20% of First Class order volume (approximately 5,563 orders) to Standard Class would improve overall late delivery rate by approximately 11 percentage points while maintaining similar revenue per order. This is the fastest supply chain improvement available without capital infrastructure investment.

R5 Use Technology Sector as ESG and Commercial Blueprint Across All Sectors

Action Required

Document the governance structures, reporting practices, and operational approaches in Technology holdings and develop a cross-sector implementation programme to transfer those practices to Energy, Transportation, and Manufacturing. Technology's combination of second-highest ESG (63.35), highest revenue (£16.5M), and highest profit margin (18.80%) makes it the internal proof point that ESG and commercial performance are complementary.

Expected Commercial Impact

If Energy and Transportation improved profit margins toward Technology's 18.80%, the portfolio-level financial impact would be significant given their combined revenue base. ESG improvement in those sectors would also improve access to green financing instruments, which are increasingly important for large-scale capital projects.

SECTION 5

Board KPI Monitoring Framework

Metrics to track quarterly to measure progress against all five recommendations

KPI	Current Value	Target	Timeline	Linked Rec
First Class Late Delivery Rate	95.3%	Below 50%	6 months	R1
Total Portfolio Late Delivery Risk	54.8%	Below 35%	12 months	R1 + R4
Portfolio Carbon Emissions Growth	+76% (10yr)	Net zero growth	3 years	R2
Energy Sector Carbon Intensity	9.73B units	-20% reduction	3 years	R2
Africa ESG Score	44.51	Above 54.62	3 years	R3
Middle East ESG Score	43.44	Above 54.62	3 years	R3
Standard Class Order Share	59.7%	Above 70%	12 months	R4
Order Cancellation Rate	4.3%	Below 2%	12 months	R1 + R4
Portfolio Avg ESG Score	54.62	Above 60	3 years	R2+R3+R5
Portfolio Avg Profit Margin	10.9%	Above 13%	3 years	R5

Data Methodology Note

All findings are derived from three datasets: ESG and Financial Performance (11,000 company-year records 2015 to 2025), DataCo Supply Chain (180,519 orders 2015 to 2018), and World Bank Development Indicators (261 countries 2015 to 2024). Analysis was conducted using Power BI Desktop v2.156.951.0 with a star schema semantic model and DAX measures across four PL-300 exam domains.
